

1. What is a Request String?

Answer:

A Request String is also called a **URL (Uniform Resource Locator)**. Using the Request String, we are locating a particular resource and sending the request to that resource. It is also called a Query String.

2. What are the two parts of a Request String?

Answer:

A Request String has two parts.

- First one is **Resource Path**.
- Second one is **UI Data or Form Data**.

3. What should we know before building a Web Application?

Answer:

Before building a Web Application, we should know what all we have inside the Web Application and what all technologies we have to use to build that Web Application.

4. What components are involved in a Web Application?

Answer:

A Web Application consists of the **Client, Server, Internet, and Web Server Software**. These are the components involved in a Web Application.

5. What are the three main parts required to build a Web Application?

Answer:

To build a Web Application, we need:

- Frontend
- Backend
- Database

The Frontend is what the user can see. The Backend contains the application logic. The Database is used to store the application's data.

6. Which technologies are commonly used to build the Frontend?

Answer:

The Frontend is commonly built using:

- HTML
- CSS
- JavaScript
- React

These are the frontend technologies that are very popular and widely used.

7. Why is Backend Technology required?

Answer:

If we want to build the Backend, we have to use some Backend Technology. The Backend contains the application logic that processes the request.

8. Why is a Database required in a Web Application?

Answer:

If we want to store data in a Web Application, we need a Database. The Database is used to store the application's data.

9. What is a Tech Stack?

Answer:

The Tech Stack used by a Web Application is the combination of technologies used to build that Web Application.

10. What is the Tech Stack if React, Java, and MySQL are used?

Answer:

If React is used for the Frontend, Java is used for the Backend, and MySQL is used for the Database, then the Tech Stack used to build the Web Application is **React, Java, and MySQL**.

11. What happens if React, Express, Node, and MongoDB are used together?

Answer:

If React is used for the Frontend, Express and Node are used for the Backend, and MongoDB is used for the Database, then it becomes the **MERN Stack**

12. Why do we need to understand the components of a Web Application?**Answer:**

If we know only the components of a Web Application, we cannot build it. We should understand what components are present, how the Web Application works, and what technologies are required to build it.

13. What should be understood after learning the working of a Web Application?**Answer:**

After understanding how a Web Application works, we should understand what is present inside the Web Application and what technologies are required to build it.

14. What is the purpose of the Resource Path in a Request String?**Answer:**

The Resource Path is used to identify the particular resource. Using the Request String, we locate that particular resource and send the request to it.

15. What is UI Data or Form Data?**Answer:**

UI Data or Form Data is the second part of the Request String. It contains the data entered by the user and is sent along with the request.

These questions are based **only on the technical concepts discussed in the transcript**, and the answers follow the transcript's wording as closely as possible rather than being rewritten into textbook-style explanations.
